## SALMONELLOSIS - New Jersey, New York, Pennsylvania

Between May 25 and May 28, 1966, there were at least 13 separate outbreaks of febrile gastroenteritis associated with the consumption of smoked fish and involving over 400 persons in New Jersey, New York and Pennsylvania. Illness occurred primarily in Jewish adults approximately 14-24 hours after eating a meal which included smoked fish. Though the illness has been severe, in some instances requiring hospitalization, no deaths have been reported.

*Salmonella javae* has been isolated from cultures from 10 patients in New Jersey and from three specimens of

## EPIDEMIOLOGIC NOTES AND REPORTS

## SALMONELLOSIS—New Jersey, New York, Pennsylvania (Continued from front page)

All of the outbreaks have been traced to the smoked fish product of one company which distributes primarily in the States of New Jersey, New York and Pennsylvania. The management of the company has voluntarily closed the involved plant and recalled the potentially contaminated smoked fish produced since May 25. Over 100 environmental samples have been collected and are being examined for the presence of salmonellae. *S. java* has been isolated from rectal swabs from 5 of the 30 employees at the plant. Investigations are continuing.

(Reported by Dr. William J. Dougherty, Director, Division of Preventable Disease Control, New Jersey State Department of Health; Dr. Julia L. Freitag, Director, Epidemiology Division, New York State Department of Health; Dr. Harold Fuerst, Assistant Commissioner of Health for Preventable Diseases, New York City Health Department; Dr. William D. Schrack, Jr., Director of Communicable Diseases, Pennsylvania Department of Health; Dr. Sylvan M. Fish, Chief, Communicable Diseases Section, Philadelphia Department of Health; the Food and Drug Administration; and a team from CDC.)

## VESICULAR STOMATITIS — New Mexico and Colorado

An outbreak of vesicular stomatitis occurred in the summer of 1965 in northwest New Mexico and southwest Colorado (MMWR, Vol. 14, No. 36). The etiology was confirmed as VS virus, Indiana type, by virus isolation from vesicular lesions of cattle.

As a result of unconfirmed reports of vesicular stomatitis infection in humans in late July, 41 individuals who had had some degree of contact with infected animals

were interviewed. Throat swabs and sera were obtained from each person for viral isolation and serological studies. Twenty-four of the 41 persons gave a history of influenza-like illness, upper respiratory tract infections, stomatitis, or cutaneous vesicles. Results of the studies have demonstrated that 9 of the 41 have serologic evidence of infection with vesicular stomatitis virus, Indiana strain. Seven of these nine persons had experienced

clinical illness during the summer of 1965; the other two were asymptomatic. One of the asymptomatic persons had experienced a clinical illness compatible with vesicular stomatitis in June 1964 following laboratory exposure to VS virus. Symptomatology of these nine cases is summarized in Table 1.

One isolation of vesicular stomatitis virus was obtained in the Arbovirus Vector Laboratory of CDC from a pool of *Aedes* species (probably *A. dorsalis*) mos-

quitoes collected during September 1965 in New Mexico. This is the first isolation of vesicular stomatitis virus to be reported from mosquitoes.

(Reported by Dr. H. Gordon Doran, State Epidemiologist, New Mexico Department of Public Health; Dr. C. S. Mollohan, State Epidemiologist, Colorado State Department of Public Health; Arbovirus Vector Laboratory, Virology Section, Laboratory Branch, CDC; and an EIS Officer.)

#### ANNUAL SURVEILLANCE SUMMARY MALARIA - 1965

Surveillance data have been received on 156 cases of malaria with the onset of illness in the United States and Puerto Rico during 1965. This is the second highest total in the 10-year history of malaria surveillance; in Table 2 is a comparison with the annual totals since 1956. All but two cases have been categorized as imported; the exceptions are one cryptic and one introduced case. There were 51 cases among military personnel and 105 among civilians; of the latter, 17 cases were among members of the Peace Corps, 15 among seamen and 5 among missionary families. Table 3 shows the parasite species identification in the 144 cases in which this was available.

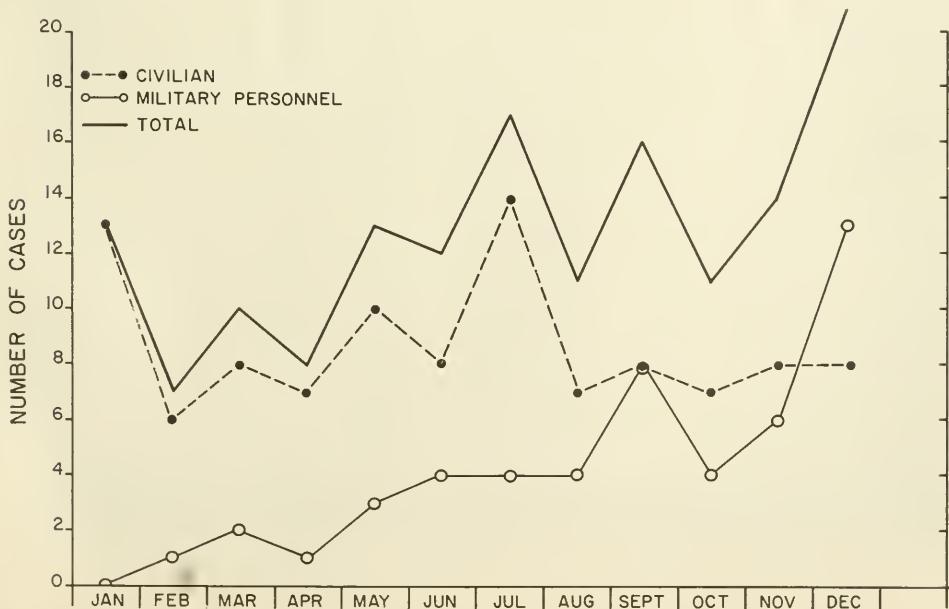

The majority of persons affected were young adults

and 58.9 percent of cases occurred in the 10-29 year age group; females of all ages accounted for 16.7 percent of the total. The country or area in which the malaria was contracted was defined in 143 instances; 66 persons were infected in Asia and 51 in Africa.

There were 110 patients who had not had malaria before; an additional 17 patients had had one or more attacks of malaria previously. In 29 instances no information was available regarding the previous history of malaria. Foreigners visiting the U.S. accounted for 19 of the cases; of these 6 had had malaria before.

The month of onset of the illness in 153 of the patients is shown in Figure 1. As the year progressed there was a sharp relative increase in cases due to the

**ANNUAL SURVEILLANCE SUMMARY  
MALARIA—1965**

(Continued from page 187)

Table 1  
CASES OF MALARIA BY PARASITE SPECIES  
United States, 1965\*

Species	Total	Percent
<i>P. vivax</i> . . . . .	87	60.4
<i>P. falciparum</i> . . . . .	39	27.1
<i>P. malariae</i> . . . . .	13	9.0
<i>P. ovale</i> . . . . .	5	3.5
Mixed Infections . . . . .	0	0
Total . . . . .	144**	100.0

\*Onset of illness in the United States and Puerto Rico.

\*\*12 cases with species of parasite unknown have been omitted.

Table 2  
MILITARY AND CIVILIAN CASES OF MALARIA  
United States 1956-1965\*

Year of Onset	Military	Civilian	Total
1956 . . . . .	46	79	125
1957 . . . . .	56	47	103
1958 . . . . .	33	39	72
1959 . . . . .	12	42	54
1960 . . . . .	21	42	63
1961 . . . . .	45	40	85
1962 . . . . .	75	44	119
1963 . . . . .	58	90	148
1964 . . . . .	52	119	171
1965 . . . . .	51	105	156

\*Onset of illness in the United States and Puerto Rico.

number which occurred in military personnel who had contracted the disease in Viet Nam. Sixty-nine of the 153 cases had the onset of illness during the period May 1 to September 30, 1965.

Of 35 military personnel who contracted malaria in Viet Nam and who subsequently developed symptoms during 1965 while in the U.S. or Puerto Rico, *P. falciparum* was the etiologic agent in 20 cases and *P. vivax* in 12 cases. The species was not identified in three cases.

Surveillance data also became available to the Parasitic Disease Unit on 480 servicemen in whom malaria was first diagnosed in Viet Nam and who were subsequently transferred to the U.S. either for the treatment of the malaria itself or of other conditions such as wounds. The majority of these patients had falciparum malaria and almost all experienced the onset of illness in Viet Nam during October, November and December.

The case of introduced malaria occurred in the wife of a serviceman stationed at Fort Benning in Georgia (MMWR, Vol. 14, No. 33). The case of cryptic malaria occurred in Las Vegas, Nevada, and was in a 47-year-old male patient who had resided in Assam, India, during 1944-45 (MMWR, Vol. 14, No. 51).

(Reported by the Parasitic Disease Unit, Epidemiology Branch, CDC.)

THE MORBIDITY AND MORTALITY WEEKLY REPORT, WITH A CIRCULATION OF 15,600, IS PUBLISHED AT THE COMMUNICABLE DISEASE CENTER, ATLANTA, GEORGIA.

CHIEF COMMUNICABLE DISEASE CENTER

CHIEF, EPIDEMIOLOGY BRANCH

ACTING CHIEF, STATISTICS SECTION

EDITOR: MMWR

DAVIO J. SENCER, M.D.
